

scrape_all.R includes all web scraping functions

add_lat_lng_script.R combines all files for each website separately and does some data cleaning.

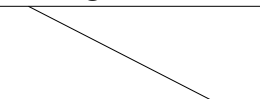

The script uses the function in insert_lat_lng_maps_api.R to add latitude and longitude values and then new folders are created in the add_lat_lng_script.R script with the augmented data.

`create_final_df.R` combines all the files with the augmented latitude and longitude values.

It uses data_augmentation_data.R to read in all the places data which reside in data/augmentation_data

It uses the function in add_distance_var_to_df.R to calculate distances and how many places fall inside a certain radius.
